

Science Summary Table

This table compares topics from 2020 with 2025, providing a quick reference to what has changed and what is new in the science of ACLS.

ACLS topic	2020	2025
Tachycardia	- Follow your specific device's recommended energy level to maximize the success of the first shock - Wide QRS complex, irregular rhythm: defibrillation dose (not synchronized)	- Synchronized cardioversion initial recommended doses: - Narrow-complex tachycardia: 100 J - Monomorphic VT: 100 J - Atrial fibrillation: 200 J - Atrial flutter: 200 J - Polymorphic VT: defibrillation dose (not synchronized) - Removed sotalol from the algorithm - Changed supraventricular tachycardia to narrow-complex tachycardia
Post-Cardiac Arrest Care	- Targeted temperature management 32-36 °C - Hold temperature for 24 hours - Do not give OHCA patients with ROSC targeted temperature management - Hypotension: <90 mm Hg - Oxygen saturation: 92%-98%	- Temperature control 32-37.5 °C - Hold temperature for at least 36 hours - OK to give OHCA patients with ROSC temperature control as long as it is not cold IV fluids - Hypotension: MAP ≥65 mm Hg - Oxygen saturation: 90%-98%
Cardiac Arrest, Chain of Survival	6 links for both chains (IHCA and OHCA): added a Recovery link to the end of both chains	6 links for 1 universal chain
ACLS topic	2025	
Stroke	Adding tenecteplase as a thrombolytic agent	
ACS	- Removed LBBB as a definitive diagnosis for STEMI - Removing clopidogrel as primary anticoagulant - Adding fentanyl (opioids) for secondary pain control (in addition to morphine) - Adding enoxaparin or fondaparinux (anticoagulants) - Adding ACE inhibitors	
Airway	- Removed 600-800 mL for ventilations, adding "one third" squeeze and focusing on chest rise. "Squeeze the bag one third and one half, enough to see visible chest rise." - Removed delivering medications down an ET tube
